

Operating Systems

(Lecture-2)

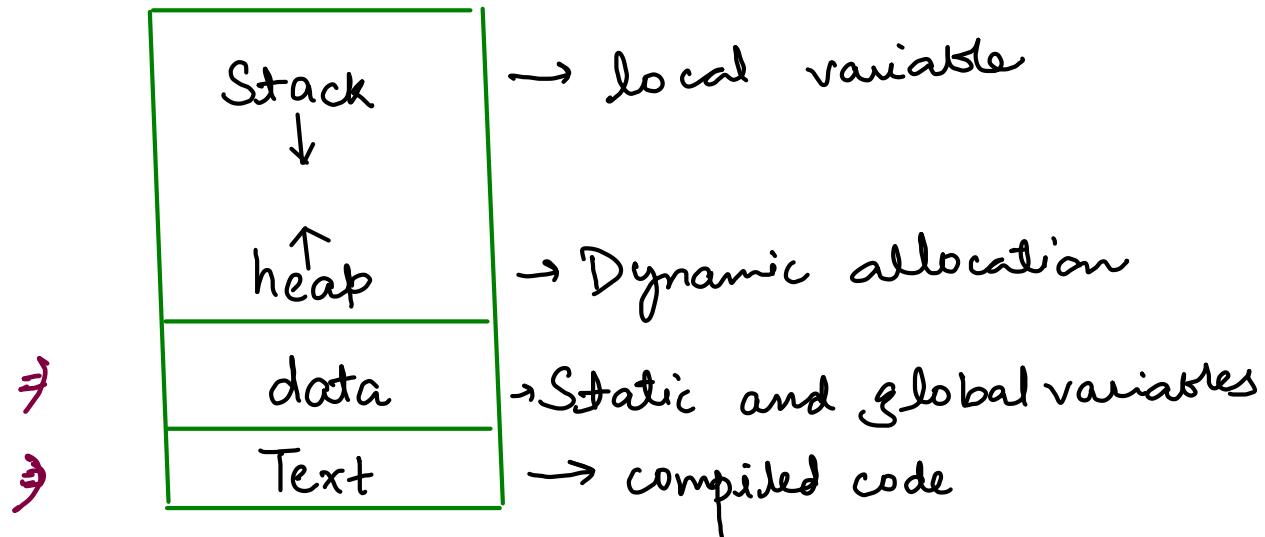

Process management

i) What is a process?

Program	Process
→ Set of instructions	→ Program under execution
→ static	→ dynamic

1) how much time? 2) In which order? } OS

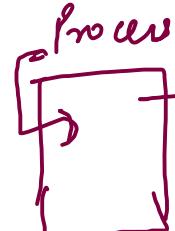

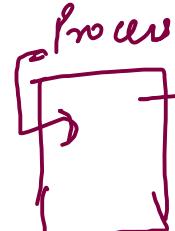

Sections of a process

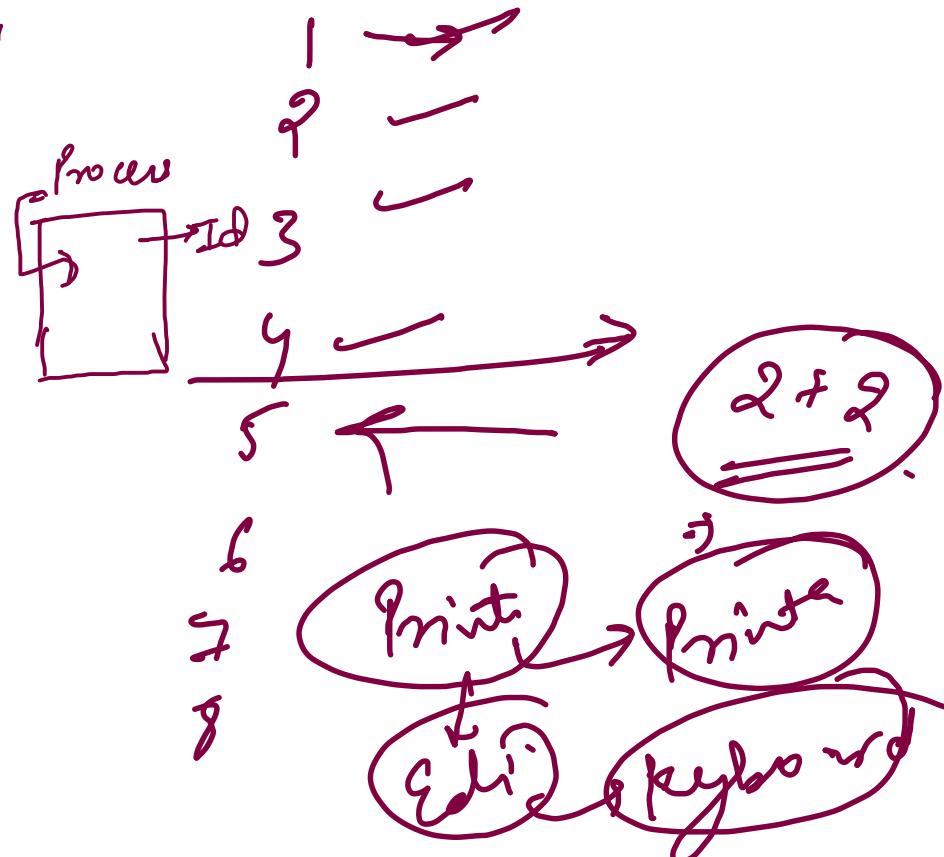

1. Load the program into memory
2. Allocate run-time stack =>
3. Allocate heap =>
4. I/O related tasks =>
5. OS hands off control to main =>

1) Mem. allocation
2) Execution
3) De allocation

PCB - process control block

- ⇒ 1) Process ID - unique identifier → P_1
 - ⇒ 2) State - process state
 - ⇒ 3) Priority -
 - ⇒ 4) Program counter - next instruction
 - ⇒ 5) CPU Registers
 - ⇒ 6) I/O information
 - ⇒ 7) Memory mgt.
 - ⇒ 8) Accounting & CPU info
- 
- 

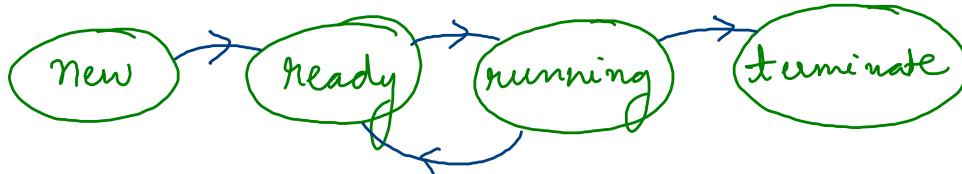

Process → Mem →
dealt

States of a process

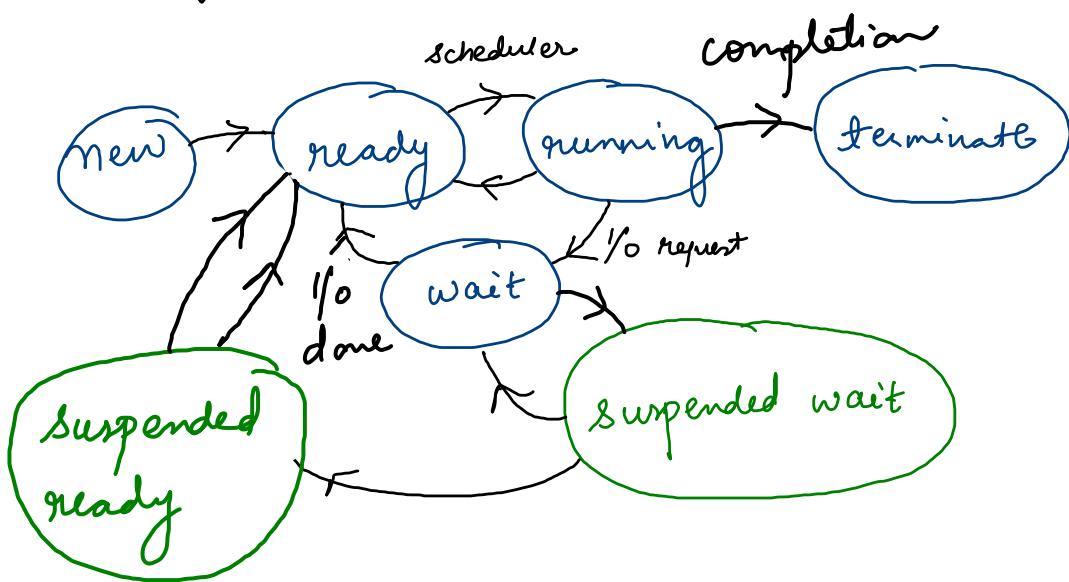

Primary States

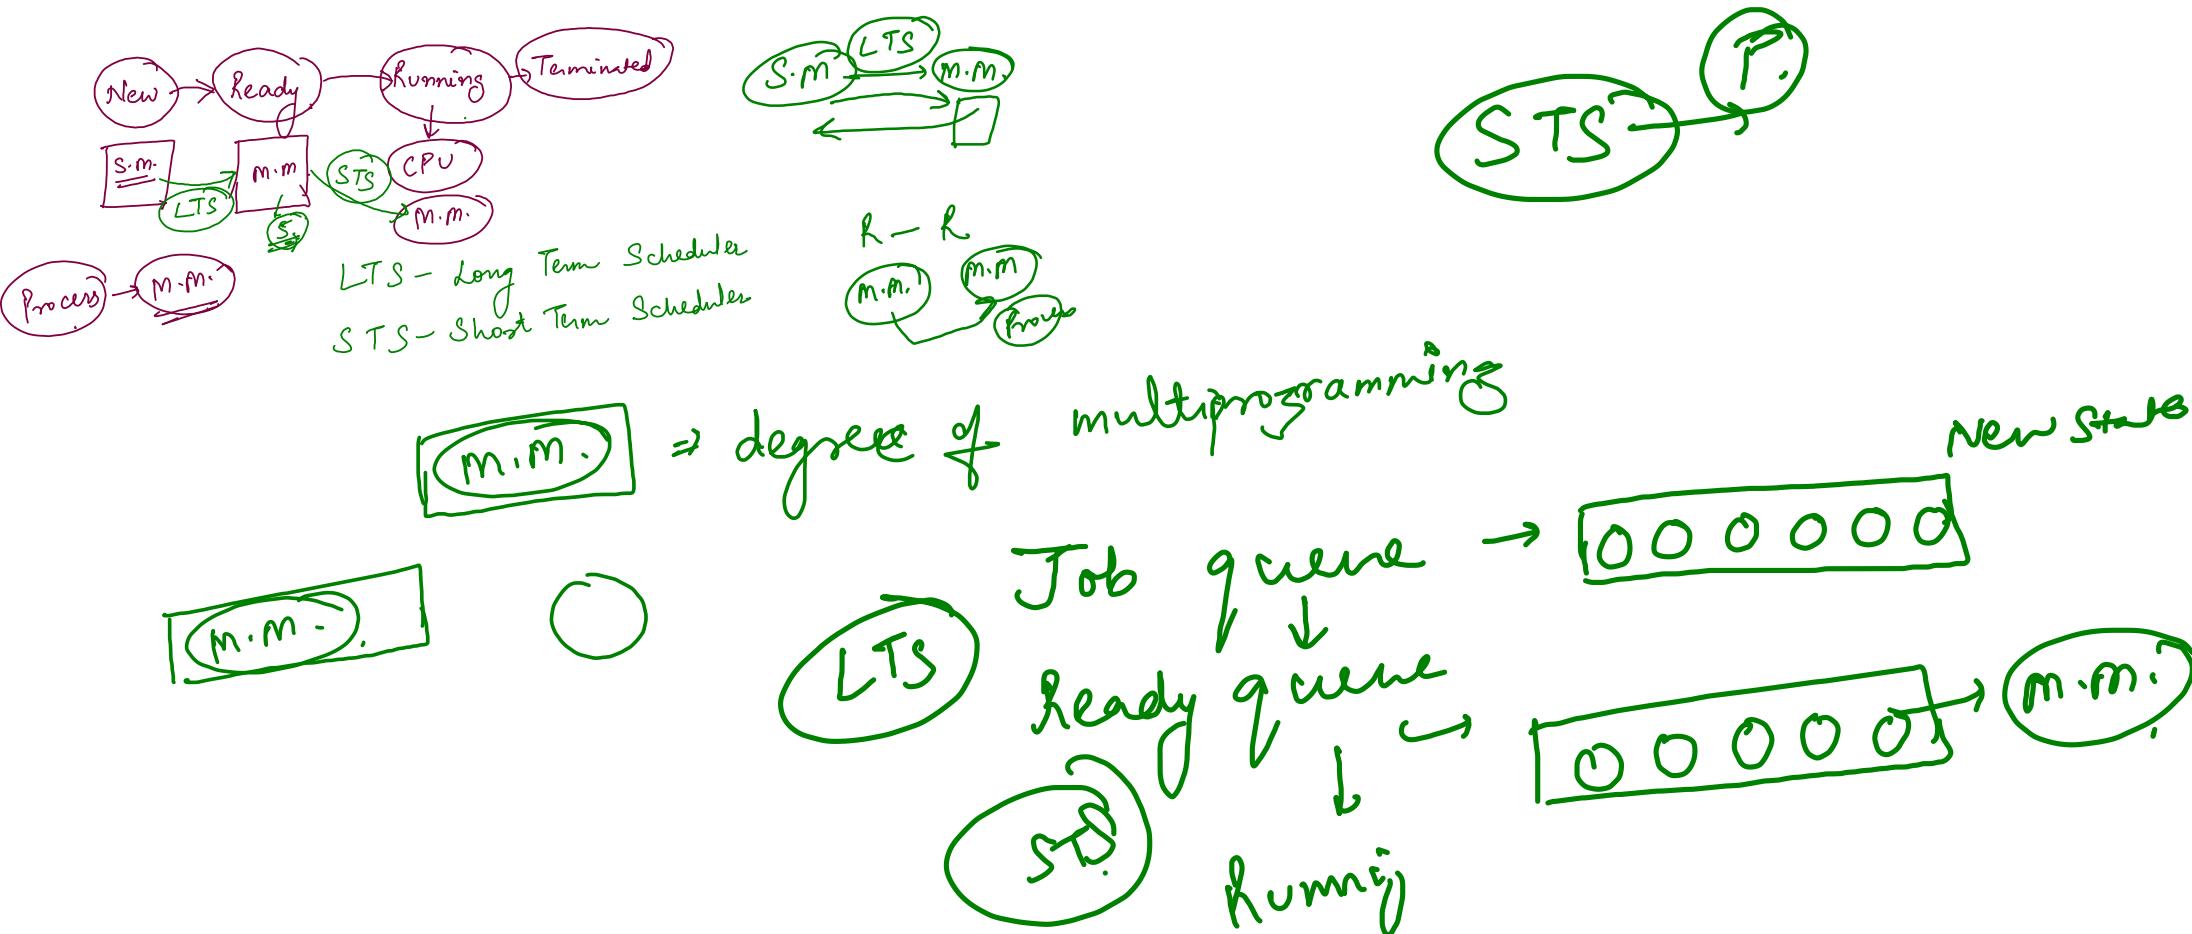

- 1) New
- 2) Ready
- 3) Running
- 4). Terminate

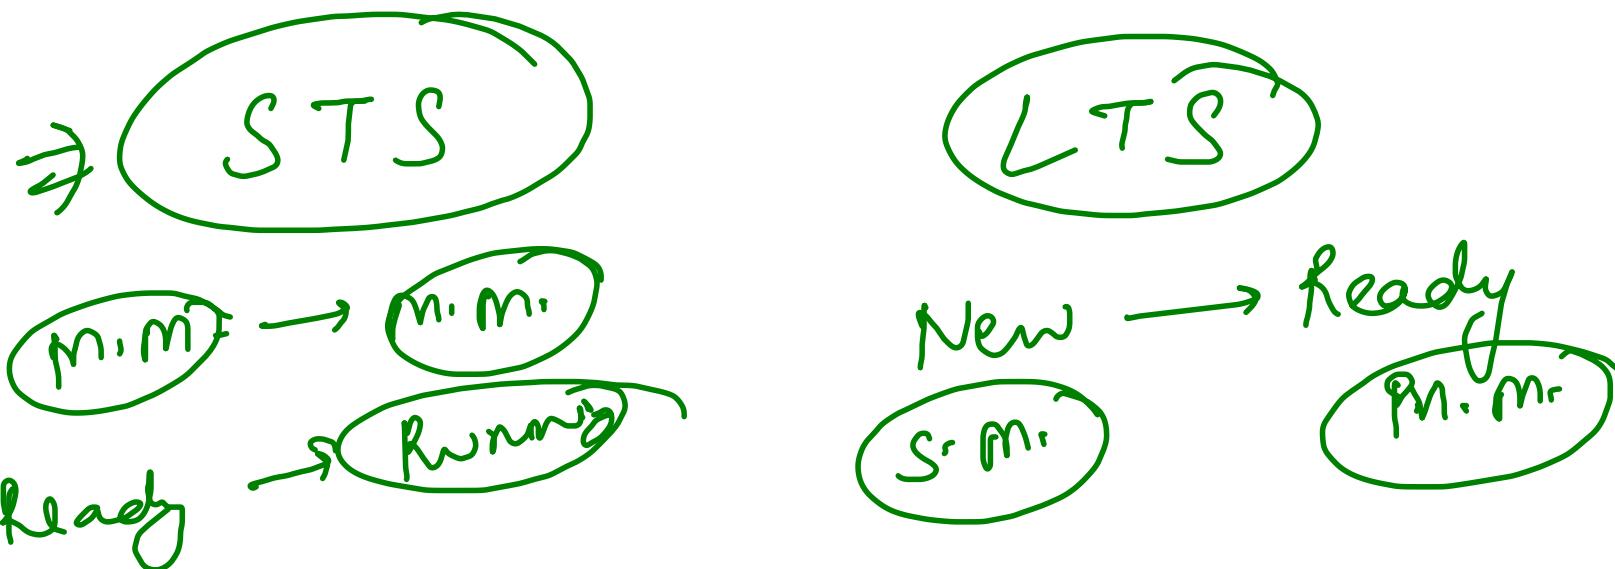

Additional states

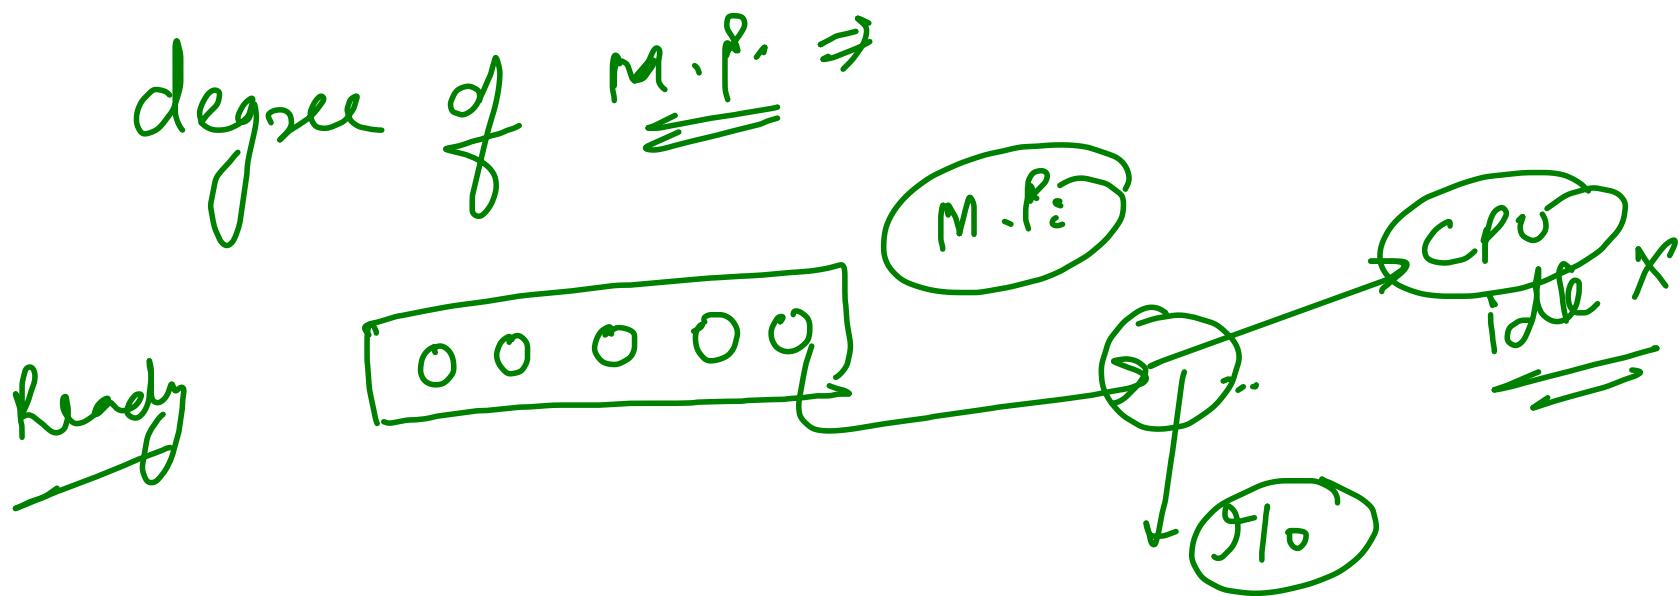

- 1) Wait
- 2) Suspended wait
- 3) Suspended ready

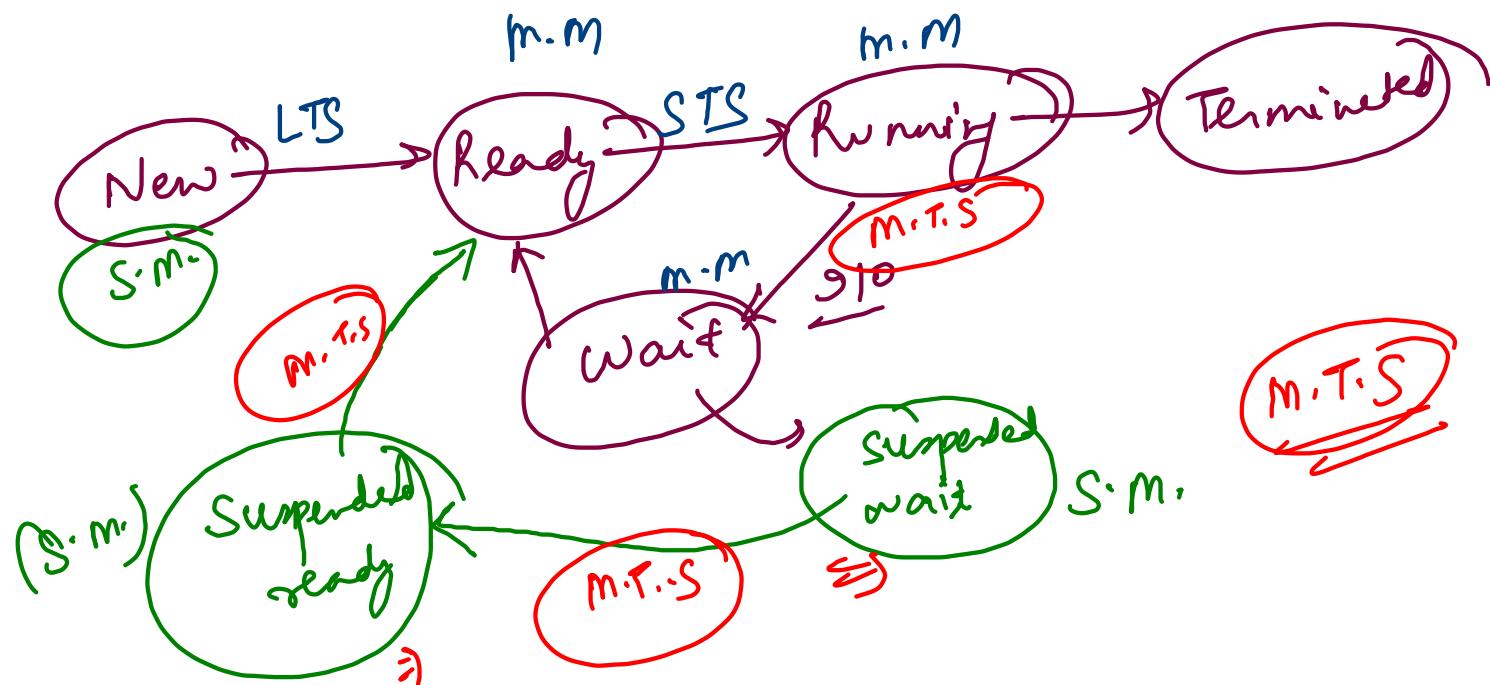

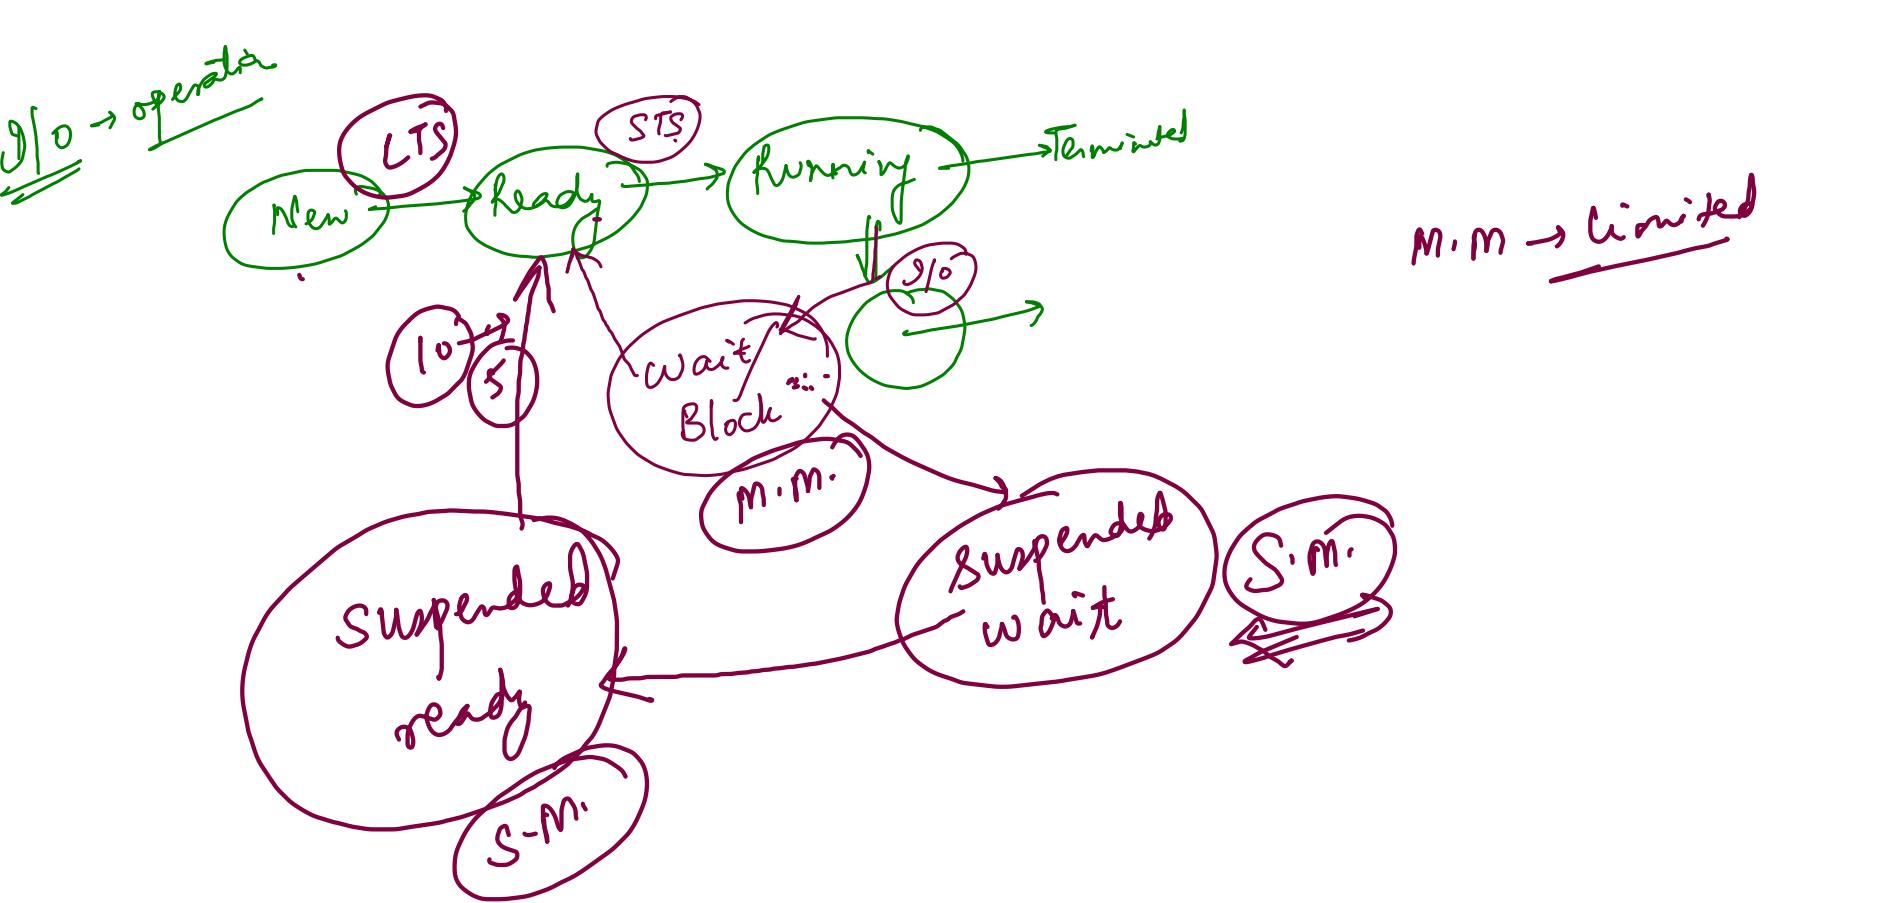

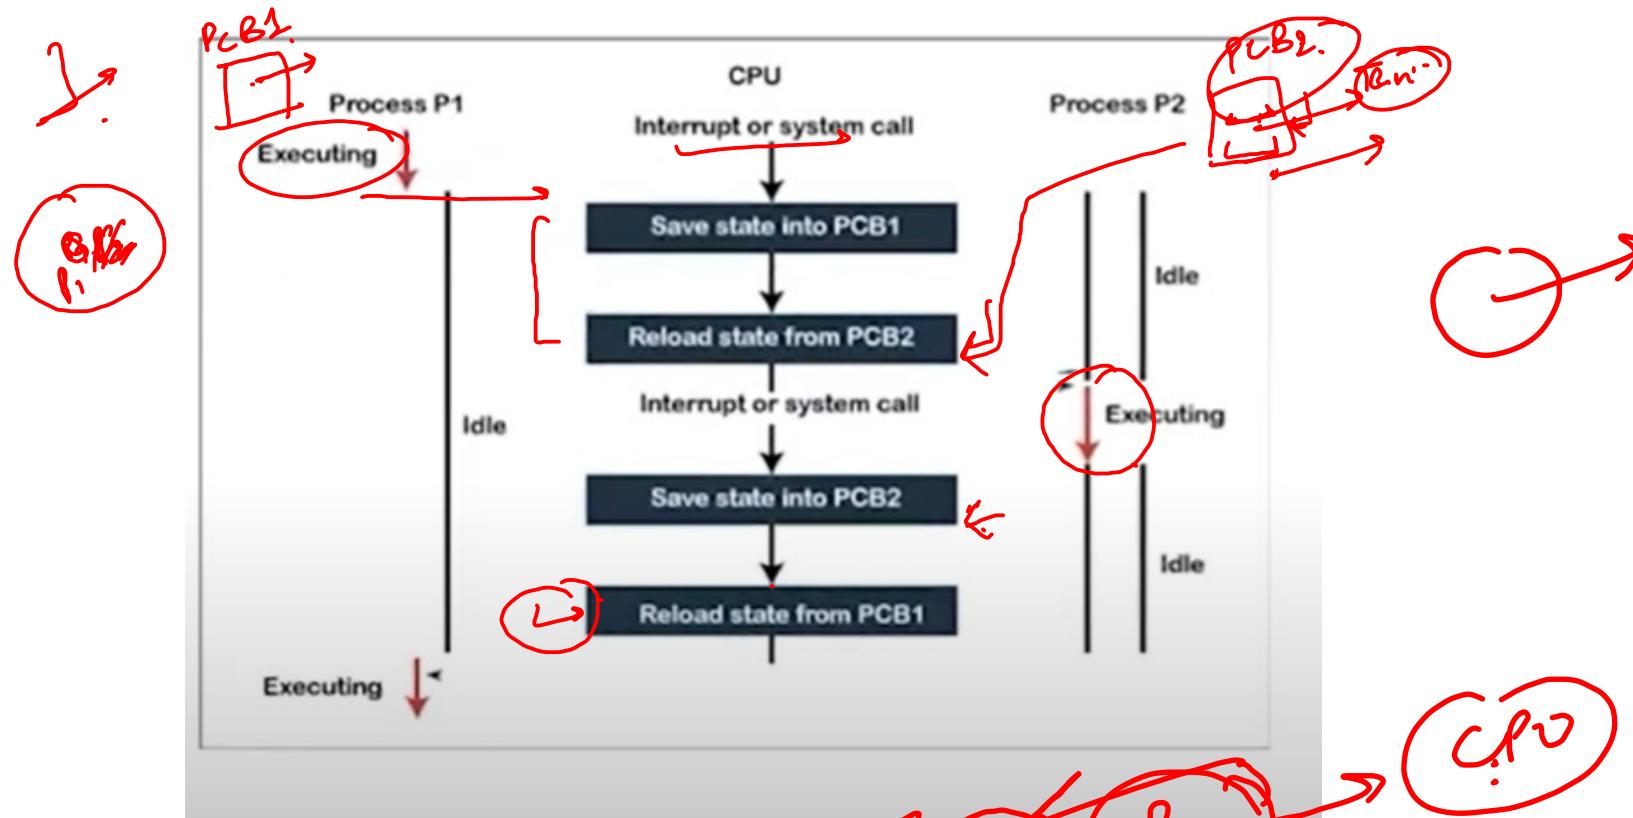

i) perle kauna process

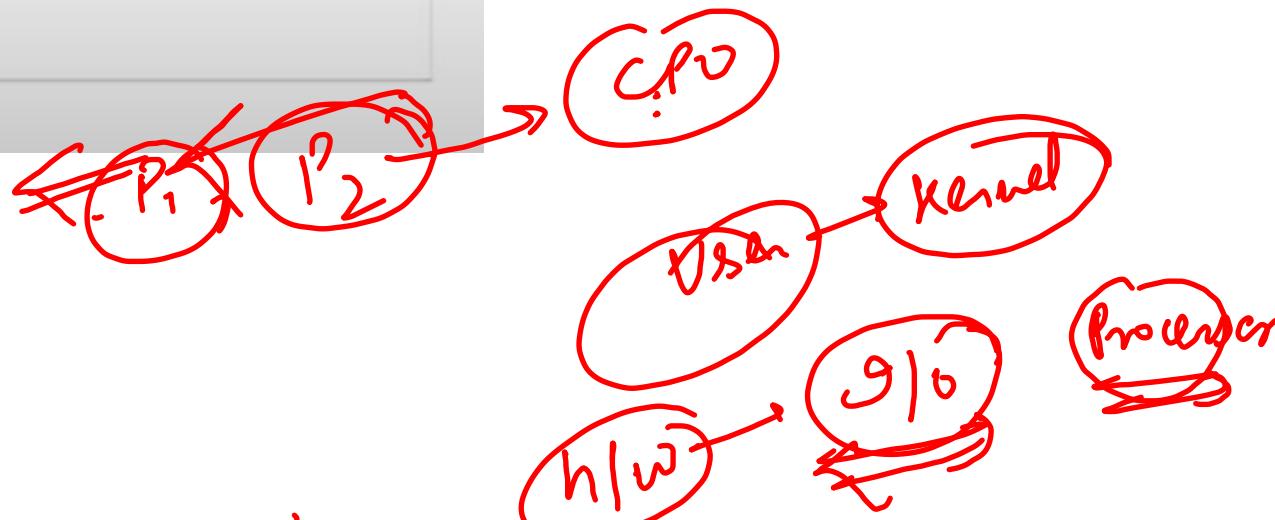

Context switching

- 1) high priority $\Rightarrow \rightarrow$
- 2) Interrupt \Rightarrow
- 3) User to kernel (switch) / I/O operation

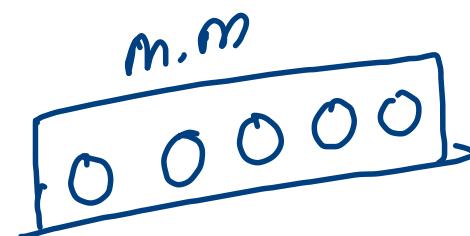

1) Job queue

- (i) process in new state
- (ii) Process in secondary memory
- (iii) LTS

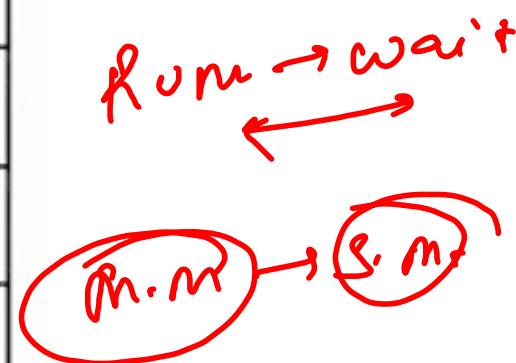

2) Ready queue

- (i) process in ready state \Rightarrow
- (ii) Process in main memory \Rightarrow
- (iii) STS

Schedulers

Long-Term Scheduler	Short-Term Scheduler	Medium-Term Scheduler
It is a Job Scheduler → [REDACTED]	It is a CPU Scheduler →	It is a process swapping scheduler →
It takes process from the job pool →	It takes process from the ready state →	It takes process from running or wait/dead state →
Its speed is lesser than short-term scheduler →	It is fastest among the two other schedulers M.M.	Its speed is in between long-term and short-term
It controls the degree of multiprogramming 3..	It has less control over the degree of multiprogramming	It reduces the degree of multiprogramming

- 1) CPU Burst - CPU time ↑
- 2) I/O Burst - I/O time ↑ CPU ↗

1) Need of scheduling
CPU utilization (Max)

Processes → CPU utilization (Max)

2) Scheduling metrics

- (i) Arrival time (AT) \rightarrow (11:00 AM)
- (ii) Completion time (CT) \rightarrow (12:00 PM)
- (iii) Burst time (BT) time req. to get execution \rightarrow (15 min)
- (iv) Turn around time (TAT) $= (CT - AT)$ (1 hr)
- (v) Waiting time (WT) $= (TAT - BT)$ (45 min)
- (vi) Response time (RT) $= (\text{process gets CPU for I time} - AT)$

R.Q.:
Termination (10 sec) \rightarrow P1
(40 min) \rightarrow R/W.
Process (30 sec)
P1 \rightarrow 90.

?

Arrival \approx M.M. \rightarrow CPU
 P_1, P_2, P_3
11:00 AM

11:30 \rightarrow 12:00
Burst 30 min

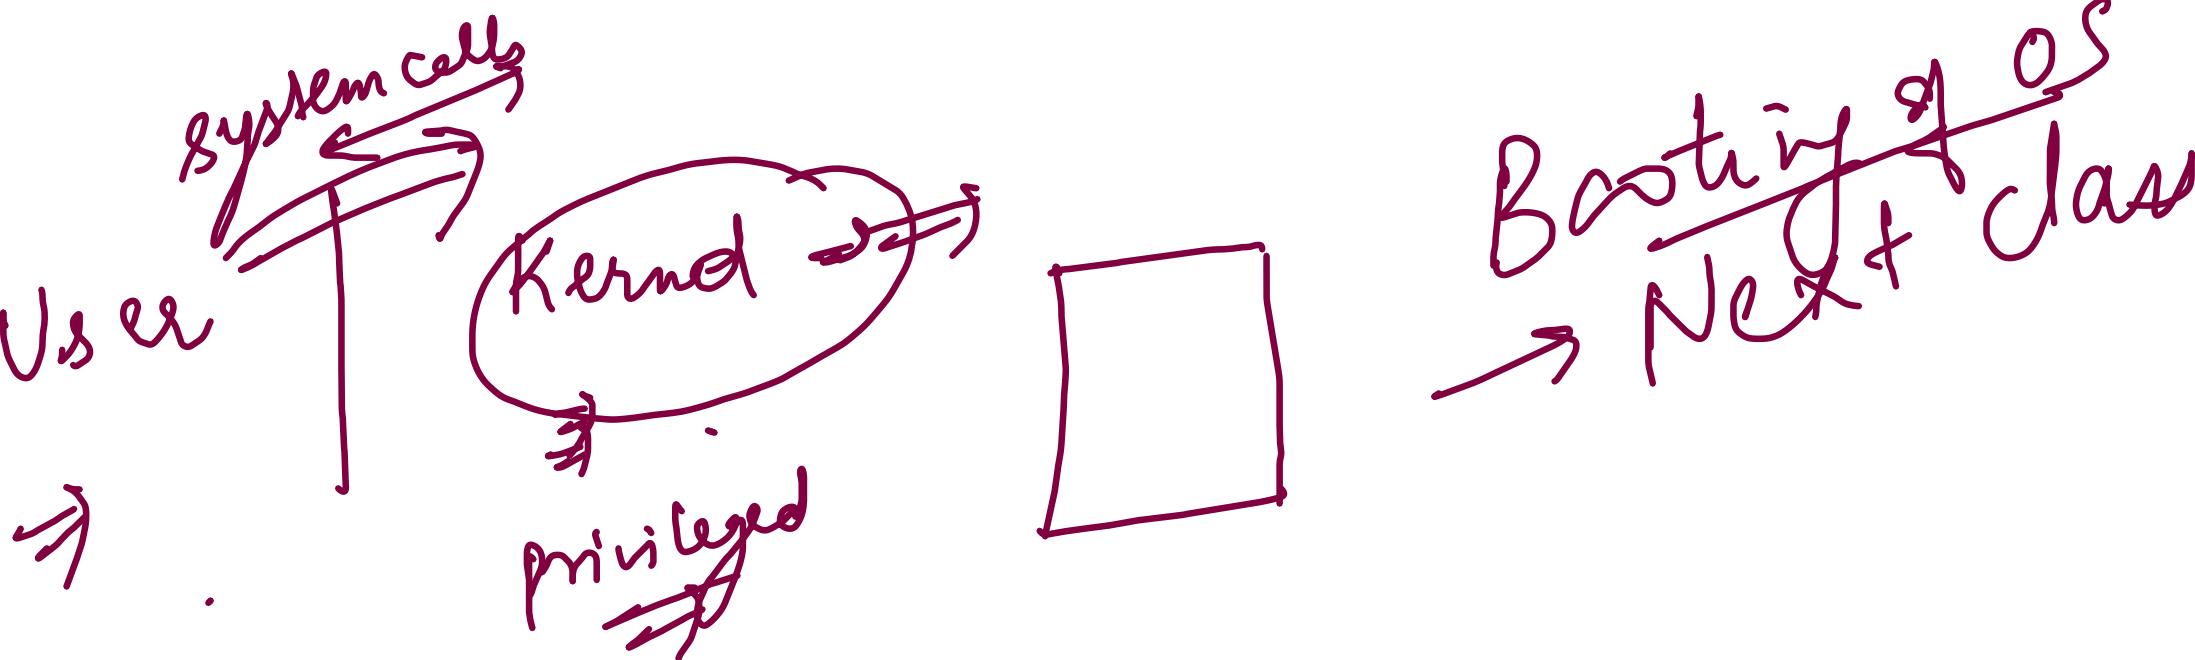

= 5

$P_1 \rightarrow 11:00$ R.Q. \rightarrow 11:05 \rightarrow 11:10 \rightarrow Wait
W-T \rightarrow 11:10 \rightarrow 11:50

TAT \Rightarrow 12:00 - 11:00 = 1 hr
5 + 45 = 50 min

11:50 \rightarrow 12:00 CPU \rightarrow 11 14 14
15 \Rightarrow B.T.
5 min of R.T.

11:00 \rightarrow 50 CPU \rightarrow 50

Scheduling

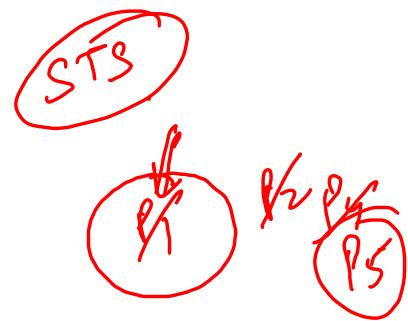

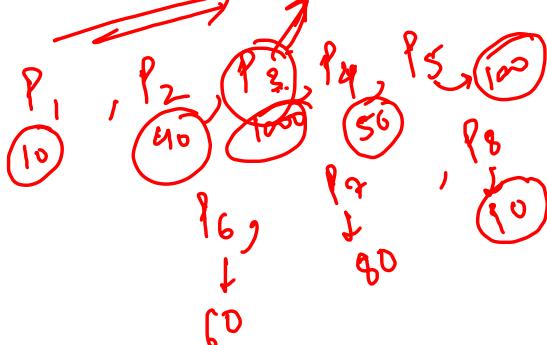

~~checkin~~ → Running

Code ready → Running

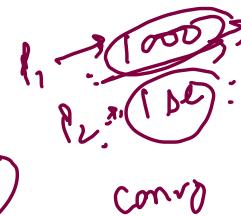

(STS)

→ Max. utilization ↑

Starvation \Rightarrow

\Rightarrow Wait

Convi

Convoy effect

Convoy

1 2 3 4 5
10 9 8 7 6

$p_1 \rightarrow 100$

$p_2 \rightarrow 200$

$p_3 \rightarrow 300$

$p_4 \rightarrow 400$

$p_5 \rightarrow 500$

$p_6 \rightarrow 600$

$p_7 \rightarrow 700$

$p_8 \rightarrow 800$

$p_9 \rightarrow 900$

$p_{10} \rightarrow 1000$

- 1) Starvation - When high priority processes keeps executing & low priority processes get blocked for indefinite time.
- 2) Convoy effect - when one slow process, slows down the performance of entire system.
